88. Merge Sorted Array

Easy  14398  1831  Add to List  Shar

You are given two integer arrays `nums1` and `nums2` , sorted in **non-decreasing order**, and two integers `m` and `n` , representing the number of elements in `nums1` and `nums2` respectively.

Merge `nums1` and `nums2` into a single array sorted in **non-decreasing order**.

The final sorted array should not be returned by the function, but instead be *stored inside the array* `nums1` . To accommodate this, `nums1` has a length of `m + n` , where the first `m` elements denote the elements that should be merged, and the last `n` elements are set to `0` and should be ignored. `nums2` has a length of `n` .

Example 1:

Input: `nums1 = [1,2,3,0,0,0]`, `m = 3`, `nums2 = [2,5,6]`, `n = 3`
Output: `[1,2,2,3,5,6]`
Explanation: The arrays we are merging are `[1,2,3]` and `[2,5,6]`. The result of the merge is `[1,2,2,3,5,6]` with the underlined elements coming from `nums1`.

Example 2:

Input: `nums1 = [1]`, `m = 1`, `nums2 = []`, `n = 0`
Output: `[1]`
Explanation: The arrays we are merging are `[1]` and `[]`. The result of the merge is `[1]`.

Example 3:

Input: `nums1 = [0]`, `m = 0`, `nums2 = [1]`, `n = 1`
Output: `[1]`
Explanation: The arrays we are merging are `[]` and `[1]`. The result of the merge is `[1]`. Note that because `m = 0`, there are no elements in `nums1`. The `0` is only there to ensure the merge result can fit in `nums1`.

Constraints:

- `nums1.length == m + n`
- `nums2.length == n`
- `0 <= m, n <= 200`
- `1 <= m + n <= 200`
- `-109 <= nums1[i], nums2[j] <= 109`

```
1 class Solution:
2     def merge(self, nums1: List[int], m: int, nums2: List[int], n: int) -> None:
3         for i in range(n):
4             nums1[i+m]=nums2[i]
5         nums1.sort()
6
```
